Simulation Games

- Simulation games in healthcare are designed to replicate real-world medical, clinical, and logistical scenarios in an interactive, engaging, and educational format. These games are widely used for training, education, decision-making, and research purposes in both professional and academic settings
- Healthcare professionals, students, and administrators can use simulation games to explore complex medical environments, test decision-making skills, and improve their understanding of healthcare logistics, patient care, and hospital management

- Examples:
  - A simulation game that allows healthcare workers to manage critical care patients
  - A simulation game where players manage a fictional hospital and are responsible for everything from patient care to finances

of chips that takes
20 sec what is not
ordered is tossed
away

Limited production

MedLager AB

Limited inventory

can store 3 cups of
products

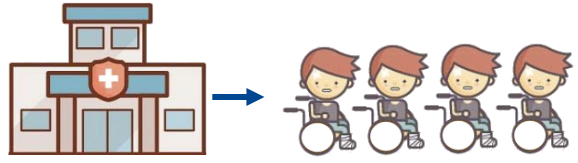

MedLager
Göteborg

Limited inventory

can store 2 cups
of products

Göteborg Sjukhus

100% service level

can store 1 cup
of products

City Game

Take on the roles of urban actors — residents, policymakers, developers, and planners — to build a perfect city!

Rules

- The players will build a city they would like to live in.
- Each player gets a turn to build a structure, and the turn then passes to the next player.
- Each player can build in any part of the play area in their turn.
- Each player gets to build one building/structure in one turn. A player may use any number of chips to represent that structure, but the entire structure is one unit.
- The player announces clearly what the building is to all the players before placing the structure.
- The player clearly writes down the choice on a post-it and sticks it the structure before placing it in the location of the choice.
